# SIEMENSRAMSEMENSBoltSIEMENSBoltSIEMENS

- maintenance-free CO<sub>2</sub> sensing element (depending on the type) based on optical infrared absorption measurement (NDIR<sup>1</sup>)
- or with VOC<sup>2)</sup> sensing element, based on a heated tin dioxide semiconductor
- CO<sub>2</sub> temperature (active or passive) and CO<sub>2</sub> humidity-temperature multisensor
- No recalibrations required
- Operating voltage AC 24 V or DC 15...35 V
- Signal outputs DC 0...10 V or DC 0...5 V adjustable
- Selectable passive temperature sensing element

NDIR = Non dispersive infrared 1)

VOC = volatile organic compounds (also called mixed gas) 2)

Use

In air ducts of ventilation and air conditioning plant to enhance room comfort and to optimize energy consumption by providing demand-controlled ventilation. The sensor acquires:

- CO<sub>2</sub> concentrations
- VOC concentrations as an indication of odors in the duct air, such as tobacco smoke, body odor, or material fumes
- · The relative humidity of the duct air
- The duct air temperature

Sensors QPM1100 and QPM21... can be used as a:

- · Control sensor in the supply or extract air duct
- Transmitter for building automation and control systems and / or display units (QPM21...D only).

Typical use:

- Acquisition of CO<sub>2</sub> and VOC concentrations:
- In party rooms, lounges, fair pavillions and exhibition halls, restaurants, canteens, SIEMENSBOHSIEMENSBOHSIEME Building Technologies

 Acquisition of CO<sub>2</sub> concentrations:
 Acquisition plant of rooms with values of rooms In ventilation plant of rooms with varying occupancy levels where smoking is prohibited, such as museums, theatres, movie theatres, auditoriums, office spaces and school rooms

Important!

- The QPM21... sensors are not suited for use as safety devices, such as gas or smoke warning devices!
- The sensors must <u>not</u> be used outdoors!

### Type summary

QPM2180	02000 ppm		Depending on connected sensing element	<b>IENS</b> R	no

### Ordering

When ordering, please give name and type reference, e.g.: Duct air quality sensor QPM2102 The sensor is supplied complete with mounting flange and cable entry gland M16.

### **Equipment combinations**

All systems and devices capable of processing the following sensor signals:

- DC 0...10 V or DC 0...5 V or
- passive sensor signals for sensor QPM2180

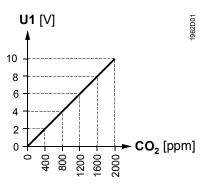

# SIEMENSBOILSIEI Mode of operation

### CO<sub>2</sub> concentrations

The Symaro<sup>TM</sup> air quality sensors acquire the  $CO_2$  concentration by infrared absorption measurement (NDIR). Owing to an additional integrated reference light source, the measurement is always accurate and no service or recalibration is needed, thus saving service costs.

The resulting output signal of DC 0...10 V or DC 0...5 V is proportional to the  $CO_2$  content of the ambient air.

Function diagram CO<sub>2</sub> (output U1)

# VOC concentration (QPM1100)

### Diagram VOC (Output U1)

Time constant "VOC signal"

CO<sub>2</sub>/VOC concentration (QPM2102 and QPM2102D) Symaro<sup>TM</sup> air quality sensors determine the mixed gas concentration (VOC) using metal-oxide semiconductor sensing elements. The sensors measure precisely at all times and with no maintenance and recalibration required thanks to an integrated compensation mechanism, saving service costs.

The sensor provides a DC 0...10 V or DC 0...5 V output signal proportionate to the VOC content of the ambient air.

Select the time constant for VOC measurement by limiting the maximum slew rate for the VOC signal. The jumper X4 (measuring range) fine tunes the time constant for VOC ventilation demand.

The center position (R2) produces a normal slew rate of max. 10% change to the VOC signal per minute (factory setting). The other 2 position reduce (R1, 2.5% VOC/min) or increase (R3, 40% VOC/min) the maximum slew rate. A smaller slew rate (R1) filters out short-term VOC concentration peaks, e.g. caused by a highly perfumed person passing by. The sensor reacts immediately and quickly to changes in VOC concentration at the higher slew rate (R3).

Time constant  $t_{63}$  selected by jumper X4 corresponds to <13 min (R1), <3.5 min (R2), or <1 min (R3) for a sudden change to 50% VOC.

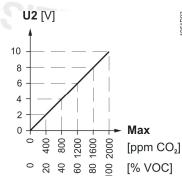

The sensor acquires and evaluates the  $CO_2$  / VOC concentration and transforms it to a ventilation demand signal.

It represents the result of maximum selection of the  $CO_2$  measuring signal and the filtered VOC measuring signal. With maximum selection, the 2 demand signals are compared and delivered as the common air quality demand.

The ventilation demand signal is delivered via output U2 as a DC 0...10 V or 0...5 V signal to be fed to the ventilation controller.

Duct air quality sensors QPM11..., QPM21...

### Ventilation demand diagram (output U2)

**Relative humidity** (QPM2162 and QPM2162D)

The sensor acquires the relative humidity in the air duct with a capacitive humidity sensing element whose capacitance changes as a function of the relative humidity. An electronic measuring circuit converts the signal from the sensing element to a continuous DC 0...10 V or DC 0...5 V signal, corresponding to a relative humidity range of 0...100 %.

**Temperature active** (QPM216...)

The sensor acquires the temperature in the air duct with a sensing element whose electrical resistance changes as a function of the temperature. The change is converted to an active DC 0...10 V or DC 0...5 V output signal (≙ 0...50 °C or -35...+35 °C).

**Temperature passive** (QPM2180)

The sensor measures the room temperature using a sensing element where electrical resistance changes with the temperature of the ambient air. The sensing element is on the device's rear side and connected at the appropriate

connection terminals.

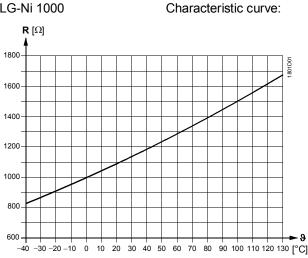

The following sensing elements are included with the device:

1961D02

- LG-Ni1000
- Pt1000
- Pt100
- NTC 10kOhm

SIEMENS/BoltSIEMENS/BoltS

Siemens **Building Technologies**  Duct air quality sensors QPM11..., QPM21...

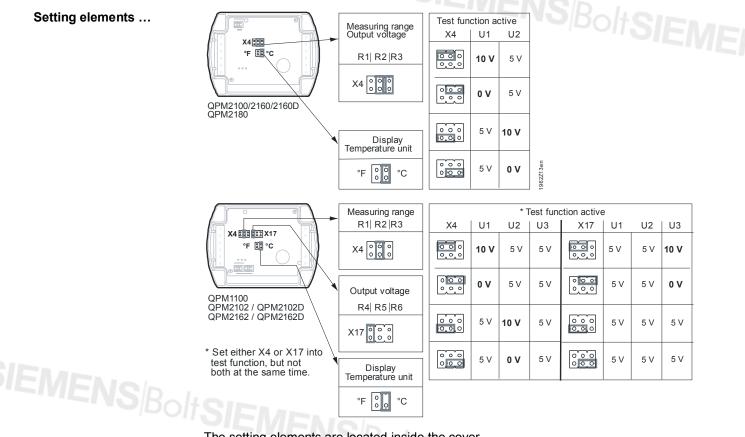

The humidity and temperature sensing elements are located at the end of the measuring probe and are protected by a filter cap.

Cable entry is made via the cable entry gland M16 (IP 54) supplied with the sensor, which screws into the housing.

Immersion rod and housing are made of plastic and are rigidly connected.

Duct air quality sensors QPM11..., QPM21...

The sensor is fitted with the mounting flange supplied with the sensor. The flange is to be placed over the immersion rod and then secured in accordance with the required immersion length.

The setting elements are located inside the cover

The different vertical plug positions have the following meaning:

• For the CO<sub>2</sub> measuring range: Shorting plug in the mid position (R2) 0...2000 ppm (factory setting) • For VOC weighting: Shorting plug in the left position (R1) VOC sensitivity " slow " Shorting plug in the mid position (R2) VOC sensitivity "normal" = (factory setting) - Shorting plug in the right position (R3) VOC sensitivity " fast " = For the temperature measuring range: - Shorting plug in the left position (R1) -35...+35 °C Shorting plug in the mid position (R2) 0...50 °C (factory setting) = • As per listing above R3 or R4 (depending on the device): Plugged in jumper = DC 0...10 V

Removed jumper = DC 0...5 V Shorting plug for the measuring range in the horizontal positions:

The signal output delivers the values according to table "Test function active".

	Filter cap (for replacement)	AQF3101	
Engineering notes	SIEMENO		
	To power the sensor, a transformer for safety windings for 100 % duty is required. When size		
	safety regulations must be complied with.		

For correct wiring, refer to the Data Sheets of the devices with which the sensor is used.

The permissible cable lengths must be observed.

Cable routing and<br/>cable selectionWhen laying the cables, it must be observed that the longer the cables run side by side<br/>and the smaller the distance between them, the greater the electrical interference.<br/>Shielded cables must be used in environments with EMC problems.<br/>Twisted pair cables are required for the secondary supply lines and the signal lines.

### Mounting notes

Mounting location and	To ensure degree of protection IP54 resp. IP65, the sensor must be fitted with the cable entry pointing downward!
orientation	The sensor should be mounted in locations where it can be easily accessed for service.
Note!	<ul> <li>If used in connection with steam humidifiers, the distance to the humidifier must be a</li> </ul>

• If used in connection with steam humidifiers, the distance to the humidifier must be a minimum of 3 m. If permitted by the installation, the distance should be as great as possible, but no more than 10 m

• The sensing elements in the immersion rod are susceptible to impact and shock. Any impact or shock should therefore be avoided
